

## CLASS ASSIGNMENT

OBJECTIVE: Create a film strip of selfies, and do image processing with tints.

- Use loop for the small white rectangles on the film.
- Use about 5 images.
- If you don't want to use selfies, you may use other pictures taken from your camera. They must be thematic in some way. Examples: campus snapshots, club members, family members, insects taken with your camera. In other words, make it personal so that you'll have more of a stake in it and so that you can get the extra experience of manipulating images.
- You must resize each to at roughly the size of the frames of the filmstrip.
- Tint the frames of in any interesting ways. The sky is the limit. For instance may decide to tint each one or use the mouse to control tinting. Another example would be to apply a pop art effect similar to Andy Warhol.
- Feel free to go above and beyond.
- No need to do write-up since it's a classwork, but be sure to comment amply so that I can follow it easily.
- Submit by Friday, 0/27.
  - Zip up the folder
  - The dropbox is called "Filmstrip class assignment"

*Example, though this one is without tints.*
